Going Text Brian Schell 2018-05-16 Windows. MacOS. Gnome. GUIs (Graphical user interfaces) have been the mainstay of home and office computers for nearly 25 years. Before that there were DOS and the Unix command lines. For most users, the mouse and the attractive, colorful user interfaces offered were more intuitive and easier to learn than the cryptic keyboard commands needed to do most tasks on text-based interfaces. For most people, GUIs are still the best way to go. Still, many of us want more performance, more efficiency, and (arguably) less complexity that can only be found through the keyboard. This book focuses on getting as much as possible done through non-graphic, non-mouse means. This means the keyboard and the text-mode screen. This means working from the command line and through text-based, non-graphical interfaces. It could mean working with older hardware, but it doesn't have to. Whether you're running on the newest I9 processor, a Mac, iPad, Android phone, Raspberry Pi, or some kind of remote terminal, you can make this happen. Actually, the flexible hardware options are just one more reason to make this switch. Can you make the switch from a \$2000 Apple laptop to a \$35 Raspberry Pi? Well... maybe. This book is here to help you find out. Even if it turns out in the end that you don't want to totally switch to text exclusively, the tools and tricks you learn here can still be used from within a terminal in any GUI system. So what do I mean by "Going Text" in this context? This means we'll be working from a command line, using text-based Unix/Linux-based software. We're going to almost entirely quit using the mouse.

We'll be using these command line tools from within Windows, MacOS, or Linux terminal apps, or on other devices by using a terminal program logged into a remote server. As I wrote this book, my alternate titles were "Going Command Line" and "Going Terminal." The final product is a bit of a mash-up of all three ideas. The book will help you get to a command line via one of the following: - On a Mac Using Terminal or iTerm2 (and you have Homebrew installed) - On Windows 10 using Linux Subsystem for Windows - On any PC using Linux - On Windows using PuTTY to SSH to a remote server - On any device using a Chrome browser and Secure Shell to SSH to a remote server - A smartphone or tablet using some kind of SSH App to connect to a remote server Once there, we look at Package Managers, Tmux, Ranger, and Midnight Commander as general-purpose power tools, then get into specific task-oriented tools for reading email, writing, spreadsheet work, notes, security, password management, web browsing, social media, graphics, audio, video, news, weather, books, task management, coding/web design, and more. There are conceptual overviews of Markdown, LaTeX, Vim, and Todo.txt systems for work.

With this 228-page book, you'll become comfortable working on the Mac's command line, starting with the fundamentals and adding more advanced topics as your knowledge increases. Now includes complete coverage of Monterey, Big Sur, Catalina, and zsh! - Exactly how commands, arguments, and flags work
- The basics of Terminal's interface and how to customize it

Next, it's on to the command line, where you'll learn:

- How to navigate your Mac's directory structure
- Basic file management: creating, copying, moving, renaming, opening, viewing, and deleting files
- Creating symbolic links
- The types of command-line programs
- How to start and stop a command-line program
- How to edit a text file in nano

You'll extend your skills as you discover how to:

- Create basic shell scripts to automate repetitive tasks.
- Make shell scripts that have variables, user input, conditional statements, loops, and math.
- See which programs are running and what system resources they're consuming.
- Quit programs that refuse to quit normally.
- Enable the command line to interact with the Finder.

- Understand and change an item's permissions, owner, and group.
- Run commands as the root user using sudo.
- Handle output with pipe (|) or redirect (> or <).
- Use grep to search for text patterns in files and filter output.
- Install new command-line software from scratch or with a package manager.
- Use handy shortcuts in the Terminal app itself and in zsh.

Questions answered include:

command line in macOS 10.15 Catalina? (A lot!)

- What are the differences between the zsh shell and the bash shell?

- What should I say when someone asks if I know how to use vi?
- How do I change my prompt to suit my mood or needs?
- What is Command Line Tools for Xcode?
- When it comes to package managers, which one should I use? Finally, to help you put it all together, the book showcases 66 real-world "recipes" that combine commands to perform useful tasks, such as listing users who've logged in recently, manipulating graphics, using a separate FileVault password, creating and editing user accounts, figuring out why a disk won't eject, copying the source code of a webpage, determining which apps have open connections to the internet, flushing the DNS cache, finding out why a Mac won't sleep, sending an SMS message, and deleting stubborn items from the Trash.
