Identification Guide for Near Eastern Grass Seeds Mark Nesbitt 2016-09-16

Archaeobotanical studies constantly encounter the carbonized grains of grasses, cultivated and

wild, but the vast diversity of wild species that are potentially present has made identification of archaeological material fraught with difficulties. This volume provides an invaluable tool for mastering these difficulties. Based on

years of laboratory study of an extensive reference collection, this book gives expert guidance for the identification and interpretation of grass seeds, focusing on those species that occur in the Near East and Europe.

Evaluation of Native Plant Seeds and Seeding in the East-side Central Cascades Ponderosa Pine Zone Nan C. Vance 2010
In dry, open coniferous forests of the montane West, stand-replacing wildfires and land use activities alter the composition and abundance of native grasses and forbs by degrading the habitat and accelerating the invasion of exotic annuals. On

these lands, native forbs and grasses delayed or prevented from recovery by natural processes may require intervention through supplementary seeding. However, effective seeding of native plants requires that their seed traits and the potential outcome of the seeding be better understood. This study evaluated seeds and seedlings of 13 native forbs and 5 grasses common in the dry *Pinus ponderosa*/*Purshia tridentata*/*Festuca idahoensis* plant communities east of the Oregon Cascades crest and their potential for establishment in a landscape altered by past grazing and a recent, stand-replacing wildfire. Their potential for germination and establishment was examined in the laboratory and in 20 test plots located within the burned boundary of a 2002 wildfire. Seed collection, handling, testing, and sowing procedures are described. Data on seedling emergence, height, second-year survival and cover are presented in tables and figures. Onsite emergence and early growth data helped to

reveal cause of early mortality related to biological and site conditions, including invasive competition, and differences in early growth and site occupancy. The study supports the efficacy of using multiple and functionally diverse species in a seeding program. Additional information on each of the 18 species is included in an appendix.

Faith in a Seed Henry D. Thoreau 1993-03-01
Faith in a Seed contains the hitherto unpublished work *The Dispersion of Seeds*, one of Henry D. Thoreau's last important research and writing projects, and now his first new book to appear in 125 years. With the remarkable clarity and grace that characterize all of his writings, Thoreau describes the ecological succession of plant species through seed dispersal. *The Dispersion of Seeds*, which draws on Charles Darwin's theory of natural selection, refutes the then widely accepted theory that some plants spring spontaneously to life, independent of roots, cuttings, or seeds. As

Thoreau wrote: "Though I do not believe a plant will spring up where no seed has been, I have great faith in a seed. Convince me that you have a seed there, and I am prepared to expect wonders." Henry D. Thoreau's *Faith in a Seed*, was first published in hardcover in 1993 by Island Press under the Shearwater Books imprint, which unifies scientific views of nature with humanistic ones. This important work, the first publication of Thoreau's last manuscript, is now available in paperback. *Faith in a Seed* contains Thoreau's last important research and writing project, *The Dispersion of Seeds*, along with other natural history writings from late in his life. Edited by Bradley P. Dean, professor of English at East Carolina University and editor of the *Thoreau Society Bulletin*, these writings demonstrate how a major American author at the height of his career succeeded in making science and literature mutually enriching. *The Seed from the East* Bertha Holt 1956 "Read how today the Holt "Adoption Program" is

Albion's Seed David Hackett Fischer 1991-03-14

This fascinating book is the first volume in a projected cultural history of the United States, from the earliest English settlements to our own time. It is a history of American folkways as they have changed through time, and it argues a thesis about the importance for the United States of having been British in its cultural origins. While most people in the United States today have no British ancestors, they have

assimilated regional cultures which were created by British colonists, even while preserving ethnic identities at the same time. In this sense, nearly all Americans are "Albion's Seed," no matter what their ethnicity may be. The concluding section of this remarkable book explores the ways that regional cultures have continued to dominate national politics from 1789 to 1988, and still help to shape attitudes toward education, government, gender, and violence, on which differences between American regions are greater than between European nations.

Potatoes, Corn, Grain and Seeds Grown in the Cold North East: Seed Catalogue for 1902 The Northern Beauty was originated by us, on our experimental farm in 1894, and the past two seasons has been sent into every quarter of the United States, Canada and Europe. We' have watched with great interest and pride the growth and development of this potato from the tiny seed, until today we have this wonderful potato. It is a strong, upright grower, early as the Early Rose, resisting the ravages of blight remarkably well, in fact better than any potato of its class. Mainstreaming efficient legume seed systems in Eastern Africa Food and Agriculture Organization of the United Nations 2019-03-13 Legumes are important components of sustainable farming systems. They are useful to diversify and intensify cropping systems; fix atmospheric nitrogen and improve soil health; act as rotation crops; increase and diversify smallholder incomes; and lower the carbon footprint, mitigating climate change. Legumes can therefore play a critical role in achieving the Sustainable Development Goals. However, as this publication points out, their production is challenged by various policy, regulatory, institutional and technical factors, including a lack of attention from the public sector and limited opportunity to attract private sector

investment.

Food and Agriculture Organization of the United Nations 2001 This publication presents the proceedings of a regional technical meeting held in Budapest, Hungary from 6 to 10 March 2001. The meeting was organized and implemented by the Agricultural Research Institute of the Hungarian Academy of Sciences, Martonvasar, Hungary, in close collaboration with FAO's Seed and Plant Genetic Resources Service. In line with the Rome Declaration on World Food Security and the World Food Summit Plan of Action, the meeting recognized that one of the major challenges facing most countries in the region is the need to invest significant resources in strengthening their capacity to increase the availability of good quality seed of a wider range of plant varieties. This will contribute to the

maximization of both agrobiodiversity and productivity, in order to achieve national food security while reducing environmental degradation and the depletion of natural resources."

Seeds of Control David Fedman 2020-07-23
Japanese colonial rule in Korea (1905-1945) ushered in natural resource management programs that profoundly altered access to and ownership of the peninsula's extensive mountains and forests. Under the banner of "forest love," the colonial government set out to restructure the rhythms and routines of agrarian life, targeting everything from home heating to food preparation. Timber industrialists, meanwhile, channeled Korea's forest resources into supply chains that grew in tandem with

Japan's imperial sphere. These mechanisms of resource control were only fortified after 1937, when the peninsula and its forests were mobilized for total war. In this wide-ranging study David Fedman explores Japanese imperialism through the lens of forest conservation in colonial Korea—a project of environmental rule that outlived the empire itself. Holding up for scrutiny the notion of conservation, *Seeds of Control* examines the roots of Japanese ideas about the Korean landscape, as well as the consequences and aftermath of Japanese approaches to Korea's "greenification." Drawing from sources in Japanese and Korean, Fedman writes colonized lands into Japanese environmental history, revealing a largely untold story of green imperialism in Asia.

Atlas of Seeds and Fruits of Central and East-European Flora Vít Bojnanský 2007-09-17

The Atlas of Seeds and Fruits of Central and East-European Flora presents nearly 4,800 seed illustrations, supplemented with detailed seed descriptions, brief plant descriptions, and information on the locality and the native source of plants. The Carpathian flora covered here occurs not only in the Carpathian Mountains, but also in large lowlands extending towards the south, north and east and involves introduced and invading flora of more than 7,500 species. This publication is unique on two counts. Its scope extends to an unprecedented number of different plant seeds from a wide-ranging region. Moreover, it presents descriptions in unusual detail.

Seed Policy and Programmes in the Near East and North Africa 2000 This publication presents the proceedings of the Regional Technical Meeting on Seed Policy and Programmes in the Near East and North Africa, held in Larnaca, Cyprus from 27 June to 2 July 1999. The meeting was organised by the Agricultural Research Institute in Nicosia, Cyprus in collaboration with the Seed and Plant Genetic Resources Service of the FAO. In line with the Rome Declaration on World Food Security and the World Food Summit Plan of Action, the meeting recognised that one of the major challenges facing most countries in the Near East and North Africa is the need to invest significant resources in strengthening their capacity to increase the availability of good quality seeds of a wider range of plant varieties. This will contribute to the maximisation of both agrobiodiversity and productivity, in order to achieve national food security while reducing environmental degradation and the depletion of

natural resources. The meeting proposed and agreed to establish a Regional Consultative Forum on Seed Policy and Programmes for the Near East and Africa (CFS-NENA). The forum will facilitate intercountry scientific and technical co-operation on seed production and supply, and promote crop genetic resources evaluation, conservation and utilisation in the region.

Bacillus thuringiensis (Bt) cotton seed production in North-Eastern Karnataka: An economic analysis Veerabhadrapa Bellundagi Karnataka is one of the nine major Bt cotton growing states in the country. The Bt cotton seed production focussed on the socio-economic characteristics of contract farmers, cost and return, efficiency of resource use and problems faced by the farmers in Bt cotton seed production under different companies. Five companies having highest area under Bt cotton seed production were selected for study. The present study was conducted with primary data

collected entirely based on a multistage random sampling technique from 200 Bt cotton seed production growers who have contracted with the different seed companies. The study pertained to the agricultural year 2012-13. The total cost of Bt cotton seed production varied from one company contract farmers to other company contract farmers. The total cost was found to be higher (Rs.96829) in case of JK seeds company contract farmers followed by the farmers who have contracted with Monsanto seeds company (Rs.95797). While, the net returns obtained from Bt cotton seed production was found to be higher in case of Monsanto seeds company contract farmers (Rs.46387) followed by Kaveri seeds company contract farmers (Rs.33076). The Cobb-Douglas production function revealed that the farmers who have contracted with different seed companies, the use of seed was found to be optimum across all company contract farmers. Whereas, fertilizer resource was over utilized by

farmers who have contracted with various companies. Non availability of trained labour and prevalence of high wage rate were the major constraints in case of production, where as poor technical assistance and low contract price were the contractual problems. The other problems regarding plant protection, high incidence of diseases was the major constraint in Bt cotton seed production and in case of marketing, high price of parents of Bt cotton seeds and low price of the seeds offered by the agencies were the major ones. Therefore the Bt cotton seed production technology had positive impact on Socio- economic status of farmers by increase in yield and reducing cost on inputs thereby increase in income and also standard of living.

Plant Ecology in the Middle East Ahmad Hegazy
2016-01-14 This advanced textbook explores the

intriguing flora and plant ecology of the Middle East, framed by a changing desert landscape, global climate change, and the arc of human history. This vast region has been largely under-recognized, under-studied, and certainly under-published, due in part to the challenges posed to research by political disputes and human conflict, and a treatise on the subject is now timely. The book integrates Middle Eastern plant geography and its major drivers (geo-tectonics, seed and fruit dispersal, plant functional types, etc.) with the principles of plant ecology. The authors include the many specialized adaptations to desert and dryland ecosystems including succulence, water-conserving photosynthesis, and a remarkable range of other life history strategies. They explore the formation of 'climate relicts', and describe the long history of domestication in the region together with the many reciprocal effects of agriculture on plant ecology. The book concludes by discussing conservation in the region,

highlighting five regional biodiversity hotspots where the challenges of desertification, habitat loss, and other threats to plant biodiversity are particularly acute. *Plant Ecology in the Middle East* is a timely synthesis of the field, setting a new baseline for future research. It will be important reading for both undergraduate and graduate students taking courses in plant ecology, evolution, systematics, biodiversity, and conservation, and will also be of interest and use to a professional audience of botanists, conservation biologists, and practitioners working in dryland ecosystems.
