Excerpt: ...States of America, the following, in which the relative aperture $f/4$ forms the unit. The times of exposure given in the second line of figures are also the stop numbers according to the Uniform System used on most American cameras.--Translator.. A, Since the squares of the units of light strength of the two systems have the ratio 10:4 we obtain the time of exposure in one system from the corresponding number of the other system by multiplying or dividing by 1.6. If, for instance, with a stop $f/6.3$ in the upper system we expose five seconds, for $f/8$ in the lower, we must expose $5 \times 1.6 = 8$ seconds. In order to save the photographer the work of calculation, the objectives of the Carl Zeiss optical works are figured on the system of P. Rudolph, according to brightness, in which the brightness for the stop $f/50$ is made equal to unity. We thus get the following scale for the stop numbers: In the fourth system the time of exposure is given as the stop number, so that the numbers increase as the stops decrease, while in Rudolph's system they decrease. Stops Of An Objective Set.--We may call attention in this place to the fact that the designation of the stops for a given light-strength undergoes some complication, when the same stop must be used for several objectives. This case occurs when several objectives with front stops are united in a set which also comprises their combinations. Thus, from a set of three halves, six objectives may be combined, and, therefore, there are as many stop divisions, different from each other, required. Placing all these scales on the lens tube beside the turning ring of the iris stop is in general not to be recommended because of the small space available. It is, therefore, preferable, as P. Rudolph has...

Both opticians and optometrists are trained to grind and polish lenses and then to take the surfaced lens and finish it by centering it optically and grinding the edges so that the lens fits in the shape of the chosen frame. Thoroughly revised and updated with seven new chapters to cover changes in the industry, this 2nd edition provides a step-by-step understanding of lens finishing for the optometrist or optician. Content has been completely updated, reorganized and expanded to include the most recent industry changes. Updated photos illustrate the most current types of lenses and enhance comprehension of lens finishing. Seven new chapters cover rimless and semi rimless frames; environmental and safety concerns; lens insertion and standard alignment; nylon cord and other groove mountings; lens tinting and engraving; progressive addition lenses; and lens impact and resistance testing. An appendix of specific British Standards allows the book to easily travel to the UK and other countries that fashion their dispensing programs after the UK model. The Lens Centration Skills Series provides exercises to practice lens finishing and reinforce material from the text. *The Lens and All Its Jobs* Sidney F.
